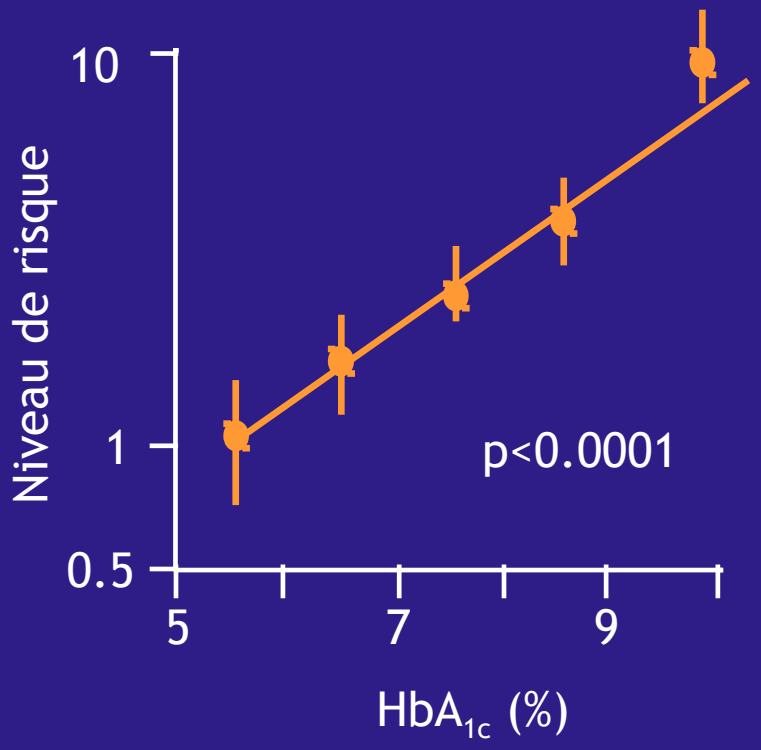
Corrélation épidémiologique entre le contrôle glycémique et le risque de complications

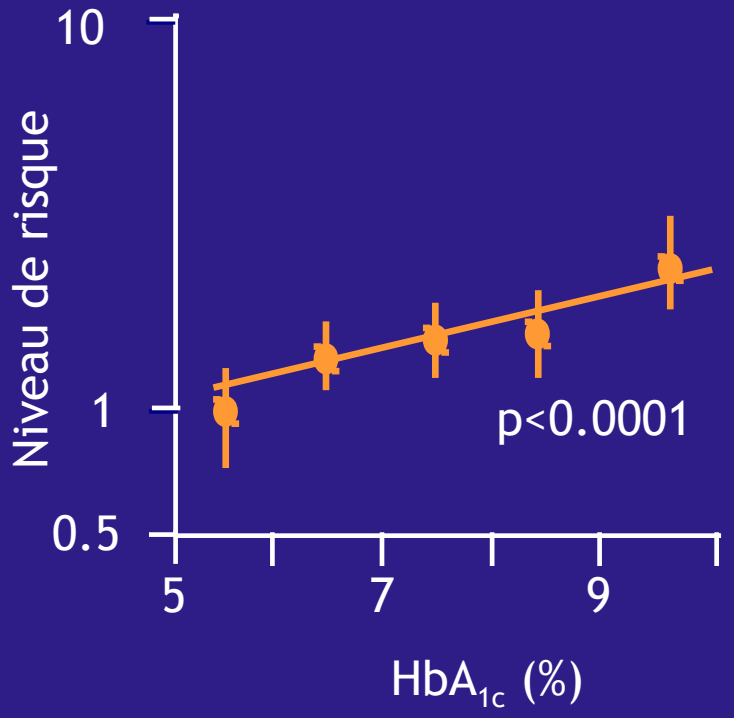
Endpoints microvasculaires

37% réduction du risque par 1% de diminution en HbA_{1c}



IM fatal et non-fatal

14% réduction du risque par 1% de diminution en HbA_{1c}



IM = Infarctus du Myocarde .

Stratton I, et al. BMJ 2000;321:405—12.

Glycaemic targets for the management of type 2 diabetes

- Glycaemic targets for the management of people with type 2 diabetes as recommended by various organisations[1–5]

Organisation	HbA_{1c} (%)	FPG (mmol/L)	PPG (mmol/L)
ADA-EASD[1]	**<7**	**–**	**–**
IDF-Europe[2]	**<6.5**	**<6.0 (<110*)**	**<8.0 (<145*)**
AACE[3]	**≤6.5**	**<6.1 (<110*)**	**<7.8 (<140*)**
NICE[4]	**<6.5****	**–**	**<8.5 (<153*)**
DDG[5]	**<6.5**	**–**	**–**

*mg/dL

**<7.5% for people receiving ≥2 oral glucose-lowering drugs or those requiring insulin

Les effets indésirables ont un impact négatif sur la compliance

Patient

- Environ un tiers des patients diabétiques, recevant des AD oraux, ont mentionné avoir ressenti des effets indésirables liés au traitement.
- Cette perception était significativement associée à une non-adhérence aux antidiabétiques.

Analyse de régression linéaire (n = 445)

Méthodologie : questionnaire remis aux patients diabétiques de type 2 sous antidiabétiques oraux

Variable	B	Valeur p
Âge		< 0,05
Comorbidité

Un patient diabétique de type 2 prend en moyenne 6,3 médicaments différents*

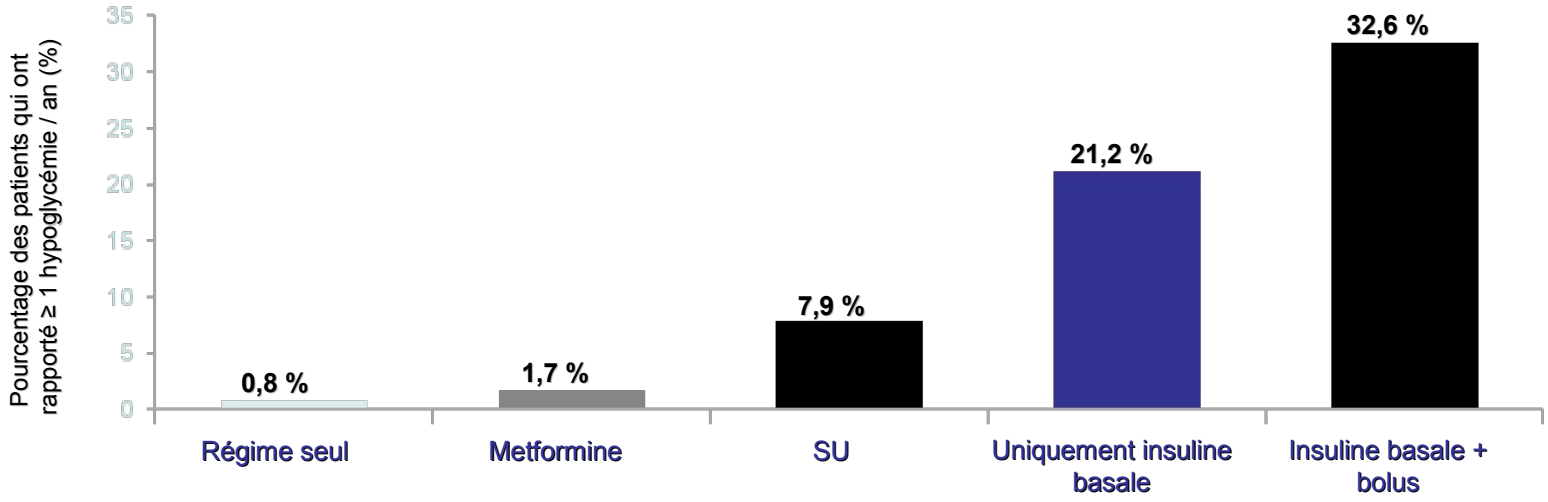
Revue adaptée d'après Chao J, et al. Clin Ther. 2007;29:177-180. *Paquot N Rev Med Liège 2010; 65: 326-310.

Barrières pour un bon contrôle

Patient

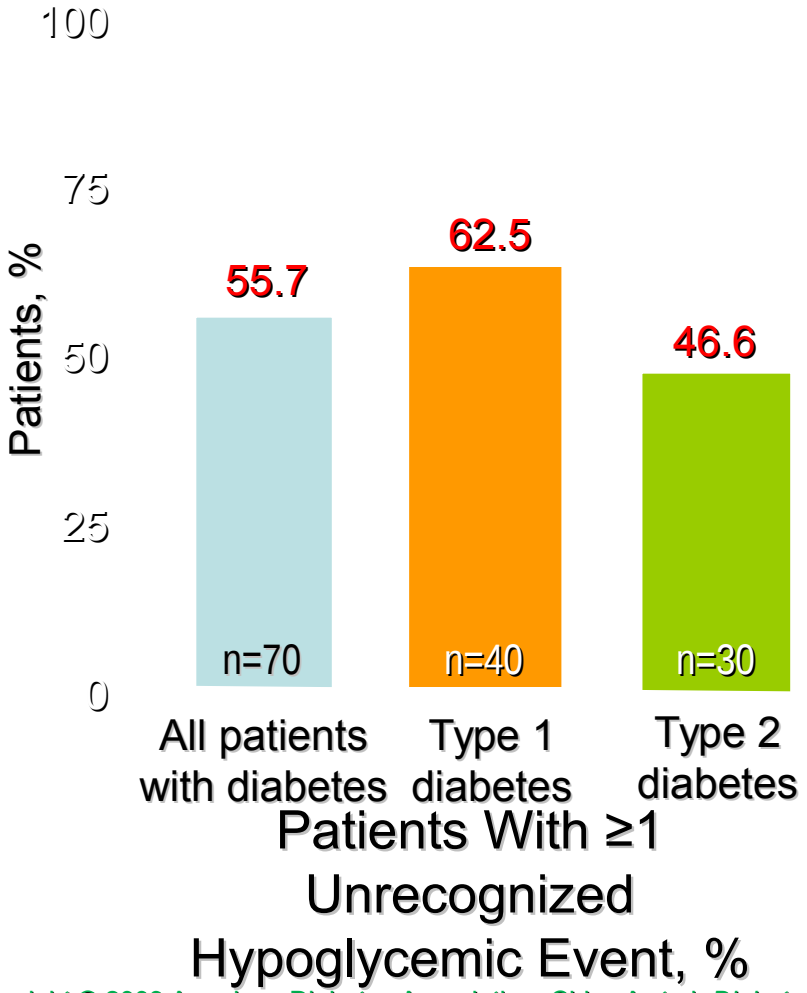
Hypoglycémies associées au traitement

- % patients ayant, par an, au moins 1 hypoglycémie liée au traitement.
- Patients diabétiques de type 2 de l'étude UKPDS.
- Les épisodes hypoglycémiques rapportés ont été classés comme transitoires, temporairement invalidants, besoin d'aide d'une tierce personne, besoin d'assistance médicale.
- Pour tous les traitements, la différence significative se situe au niveau < 0,0001.



Wright AD et al (2006) J Diabetes Complicat 20; 395-401.

Asymptomatic Episodes of Hypoglycemia May Go Unreported



- In a cohort of patients with diabetes, more than 50% had asymptomatic (unrecognized) hypoglycemia, as identified by continuous glucose monitoring[1]
- Other researchers have reported similar findings[2,3]

Summary: A Case for Use of Sitagliptin as Add-on to Metformin in Place of Sulfonylureas

- Use of DPP-4 inhibitors following metformin therapy is supported by the ADA /EASD algorithm as an option for patient treatment.[1]
- Hypoglycemia is a barrier to glycemic control.[2,3]
- In comparison to sulfonylureas, sitagliptin provided similar efficacy in reducing HbA_{1c} in patients uncontrolled on metformin, but with no weight gain and fewer reported hypoglycemic episodes.[4-7]

Sitagliptin Pooled Safety Analysis: Design[1]

19 double-blind, randomized, controlled clinical studies up to 2 years in duration

- Sitagliptin as monotherapy
- Sitagliptin in initial combination with metformin (MET) or pioglitazone (PIO)
- Sitagliptin in combination with MET, PIO, sulfonylurea (SU) (±MET), MET + rosiglitazone (ROSI), or insulin (±MET)
- Patients included in the non-exposed group received the following: placebo, MET, PIO, SU (±MET), ROSI (±MET), or insulin (±MET)

Population (N=10,246)

- Sitagliptin 100 mg/day group (n=5429)
  - 1805 patients were treated for at least 1 year
  - 584 patients were treated for 2 years
  - Mean duration of exposure was 282 days
- Non-exposed group (n=4817)
  - 1320 patients were treated for at least 1 year
  - 470 patients were treated for 2 years
  - Mean duration of exposure was 259 days

[a]Studies with results available as of July 2009.

Sitagliptin Pooled Safety Analysis: Summary of Adverse Experiences[1]

	Incidence Rate per 100 Patient-Years		
	Sitagliptin n=5429	Non-exposed n=4817	Between-Groups Difference (95% CI)[a]
1 or more AEs	153.5	162.6	–7.6 (–15.6, 0.3)
Drug-related AEs[b]	20.0	26.8	–6.4 (–8.7, –4.1)
Serious AEs	7.8	7.9	–0.1 (–1.3, 1.1)
Serious drug-related AEs[b]	0.4	0.3	0.1 (–0.1, 0.4)
Died	0.3	0.5	–0.2 (–0.5, 0.1)
Discontinued due to AEs	4.8	5.2	–0.5 (–1.5, 0.4)
Discontinued due to drug-related AEs[b]	1.7	2.3	–0.5 (–1.1, 0.1)
Discontinued due to serious AEs	1.7	1.7	–0.0 (–0.6, 0.5)
Discontinued due to serious drug-related AEs[b]	0.2	0.1	0.1 (–0.1, 0.3)

AE=adverse experience; CI=confidence interval.

[a]Between-groups difference and 95% CI based on stratified analysis. Positive differences indicate that the incidence rate for the sitagliptin group was higher than the incidence rate for the non-exposed group. "0.0" and "–0.0" represent rounding for values that were slightly greater and slightly less than zero, respectively.

[b]Considered by the investigator to be drug related.

1. Williams-Herman D et al. *BMC Endocr Disord*. 2010;10:7.

Sitagliptin Pooled Analysis: No Difference in Incidence of Pancreatitis Between Sitagliptin and Non-exposed Groups[1]

	Incidence Rate per 100 Patient-Years		
Adverse Experience	Sitagliptin n=5,429	Non-exposed n=4,817	Between-Groups Difference, (95% CI)[a]
Pancreatitis	0.08	0.10	–0.02 (–0.20, 0.14)
Chronic pancreatitis	0.04	0.03	0.02 (–0.11, 0.13)

- Preclinical and clinical trial data[a] with sitagliptin to date do not indicate an increased risk of pancreatitis in patients with type 2 diabetes treated with sitagliptin.

CI=confidence interval.
[a]Data available through July 2009.
1. Engel SS et al. *Int J Clin Pract*. 2010;6497):984–990.

Data from D Cohen, BMJ, june 2013…

Sitagliptin Pooled Safety Analysis: Malignant and Non-malignant Neoplasms[1]

Adverse Experience	n / Patient-Years of Exposure (incidence rate per 100 patient-years)		
	Sitagliptin n=5429	Non-exposed n=4817	Between-Groups Difference (95% CI)[a]
Any malignancy	46/4690 (1.0)	40/3930 (1.0)	–0.0 (–0.5, 0.4)

- Incidences of malignancies were similarly low for both treatment groups.
  - The most common malignancies were basal cell carcinoma, breast cancer (women), and prostate cancer (men).
- The incidence of non-malignant neoplasms was higher in the sitagliptin group than in the non-exposed group (1.3 per 100 PY vs 0.7 per 100 PY).
  - The most common non-malignant events were uterine leiomyoma and lipoma (women).

CI=confidence interval; PY=patient years.

[a]Betweendrug and 95% CI based on stratified analysis. Positive differences indicate that the incidence rate for the sitagliptin group was higher than the incidence rate for the non-exposed group. "0.0" and "–0.0" represent rounding for values that were slightly greater and slightly less than zero, respectively.

1. Williams-Herman D et al. *BMC Endocr Disord*. 2010;10:7.

Sitagliptin CV Pooled Safety Analysis: No Difference in MACE[a] Between Sitagliptin and Nonexposed Groups[1,b]

	Sitagliptin (n=7,726)	Nonexposed (n=6,885)
Cumulative exposure, PY	6,157	5,114
MACE, n	40	38
Incidence rate per 100 PY	0.65	0.74
RR (95% CI)	0.83 (0.53, 1.30)	

- A total of 78 patients experienced at least 1 MACE-related event

[a]MACE was comprised of ischemic events and cardiovascular deaths.
[b]13,462 of the 14,611 patients contributed to the primary analysis after exclusion of 4 studies with no events.
CI=confidence interval; MACE=major adverse cardiovascular events; PY= patient-years; RR=adjusted incidence rate ratio.

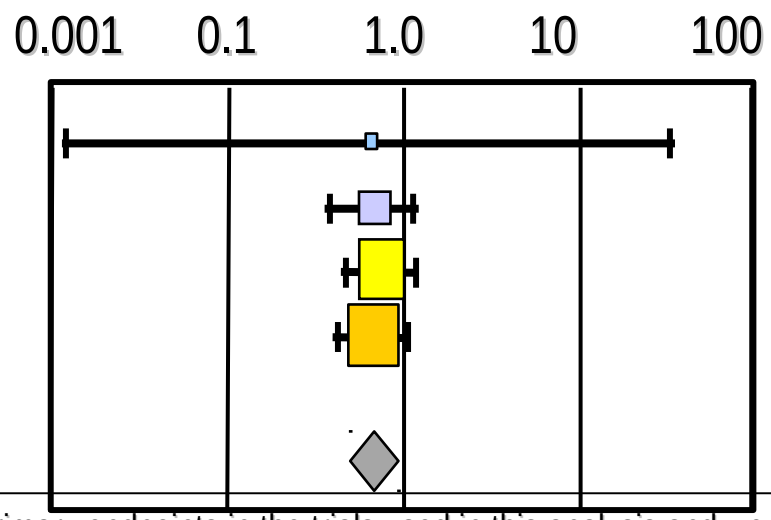
Meta-analysis of Clinical Trials With DPP-4 Inhibitors: No Evidence of Increased Risk of MACE Associated With Treatment[1]

Meta-analysis performed including all randomized clinical trials with a duration of ≥24 weeks, enrolling patients with type 2 diabetes, comparing DPP-4 inhibitors with either placebo or active drugs[a].

Drugs	Major Cardiovascular Events: MH-OR (95% CI)	*P*	# Trials
Alogliptin	0.630 [0.012, 33.048]	0.819	2
Saxagliptin	0.655 [0.382, 1.123]	0.124	8
Sitagliptin	0.740 [0.479, 1.147]	0.173	18
Vildaglptin	0.666 [0.428, 1.036]	0.072	12
OVERALL	0.689 [0.528, 0.899]	0.006	43



This meta-analysis has several limitations. Cardiovascular events were not primary endpoints in the trials used in this analysis and were only reported as AEs. Also, the short duration of trials included in this analysis do not allow for any conclusions about the long-term safety of DPP-4 inhibitors to be made.

AE=adverse event; CI=confidence interval; DPP-4=dipeptidyl peptidase-4; MH-OR=Mantel–Haenzel odds ratio.
[a]Comparators were: acarbose, GLP-1R agonists, metformin, sulfonylureas, thiazolidinediones, and placebo.
